

Journey phases	Discover How does the user first find OptiCrop?	Onboard What happens as they set up and enter data?	Analyze Core engine interaction and recommendation?	Apply What do they do with insights in the field?	Extend What happens after the harvest cycle ends?
Steps What does the person typically experience?	Hears about OptiCrop via extension officer or SMS	Creates account or logs in as guest	Inputs N, P, K values, temperature, humidity, pH, rainfall	Downloads recommendation report as PDF	Submits yield feedback and outcome data
	Visits OptiCrop website or mobile app	Selects user type: farmer, researcher, policymaker	System processes soil and climate data	Shares plan with co-farmers or agri officer	Receives next-season recommendations
	Reads about crop recommendation features	Enters location and farm details	Views recommended crop with suitability score	Implements crop selection and soil treatment	Profile shows past crop history and trends
Interactions People, places, and tools at each step	People: Extension officers, local farmers Places: Village, agri office, home Things: Mobile phone, SMS, word of mouth	People: System onboarding, no live agent Places: OptiCrop web / mobile app Things: Registration form, location picker, role selector	People: AI engine (no human in loop) Places: Dashboard — input form and results panel Things: Soil input form, recommendation card, suitability chart, PDF export	People: Co-farmers, agricultural officers Places: Farm field, agri cooperative Things: Printed report, mobile app, soil testing kits	People: System feedback loop, researcher users Places: Profile page, email, analytics dashboard Things: Feedback form, seasonal email digest, history view
Goals & motivations "Help me..." at each step Positive moments Enjoyable, motivating, or exciting steps Negative moments Frustrating, confusing, or costly steps	Help me find a trusted tool to grow better crops	Help me get started without wasting time on complex setup	Help me know exactly which crop suits my soil and climate	Help me make smart, confident decisions in the field	Help me track what worked and plan next season better
	Excited to see a data-driven solution for farming	Feels quick and intuitive — visual inputs work for low-literacy users	Delighted to see a clear recommended crop name Suitability chart gives instant visual confidence	PDF report feels official — 'like a doctor's prescription for my farm'	Users love seeing their yield history build up over seasons
	Farmers in remote areas have no internet access or device	Role selection is confusing for first-time users Long forms discourage users with low digital literacy	Farmers don't know N, P, K values without a soil test kit Recommendation output uses jargon unfamiliar to farmers	No real-time monitoring — gap between advice and execution	Feedback form feels like extra work with no visible reward Low re-engagement rate after first season
Areas of opportunity How might we improve each step?	Partner with agri networks to distribute via SMS or IVR for offline users	Pre-fill location using GPS to reduce input friction	Provide estimated N, P, K ranges based on region as defaults	Connect OptiCrop with IoT soil sensors for real-time monitoring	Gamify yield feedback with a seasonal badge on the profile
	Add multilingual support for regional languages	Describe each user role in plain-language examples	Show results in plain language alongside technical score	Send a WhatsApp reminder one week after applying recommendations	Auto-generate next-season plan 30 days before harvest
